

Press release December 2022

Powerful SPLITTER for a wide range of materials

The mobile 2/3 fraction spiral shaft screen is the mobile specialist in separating a wide range of waste types.

SPLITTER HOOK

The hook lift mobile 2/3-fraction spiral shaft separator SPLITTER HOOK consistently continues the series of hook lift mobile machines. The SPLITTER HOOK is equipped with a feeding belt that feeds the material in a well-dosed manner onto the SPLITTER. There it undergoes blockage-proof screening with the patented SPLITTER technology.

The flexible inclination adjustment of the discharge belt during operation ensures an adjustment of the discharge height of the fine fraction and even allows direct container or trailer loading. The one-piece design of the belt reduces leakage and ensures optimum discharge of the material stream. The cross belt for discharging the coarse fraction is now reversible and enables materials with a large density or volume difference to be separated into 3 useful fractions.

The use of interchangeable screen decks allows the machine to be adapted to highly variable materials. The hydraulic support feet do not only provide an adaptation to other machines and local conditions, but they can also be used to adjust the inclination of the SPLITTER in order to optimize the screening result.

The SPLITTER HOOK is equipped with 2 modes of operation. The required power can be generated by the integrated diesel generator or taken directly from the mains. The menu navigation is icon-based, which makes the machine easy, intuitive and requires no training. The main areas of application are household and commercial waste, waste wood, green waste, scrap metal, slag, compost and biowaste, but also landfill debris and construction waste.

The SPLITTER HOOK thus proves to be a mobile specialist in the separation of a wide variety of waste types, where other screening systems can cause blockages.
